

# C# 8

## C# Fundamentals, .NET Fx Intro, Types, Classes, Attributes, Delegates, Generics, Async Streams

C# 8 is the premier development language for the .NET platform. C# was designed from scratch with .NET in mind. Most of the internals of .NET Core 3 and Visual Studio are written in it. It has been selected by the majority of application teams creating commercial .NET Core 3 projects. C# builds on the rich common heritage of languages such as C++ and Java - but avoids their pitfalls and adds certain interesting new concepts, such as LINQ. There are aspects of C# that developers already know, there are some they have experienced similar but slightly different syntax in other languages, and some that are innovative ([v8 new] async streams).

C# can be used to develop stand-alone apps, local and distributed components, web services and mobile code. It produces code that can target desktop PCs, mobile devices, servers and IoT devices. C# 8 can be used for DB [EF Core], UWP, ASP.NET, WebAssembly (Blazor) & security projects. Hence it is an excellent all-round development language for all .NET Core applications. This intensive course aims to take experienced software engineers rapidly through all the major aspects of C# 8 - using plenty of demo source code and hands-on labs to show it in action. This is an ideal first course for those moving to the C# 8 language and .NET Core 3.
